

ABSTRACT OF THE DISCLOSURE

There are provided a measuring method and a  
5 measuring system which enable creation of a measurement  
route with ease to thereby enable three-dimensional  
measurement to be quickly performed even if an object to  
be measured has a complicated shape or configuration. An  
object to be measured is shot. A plurality of images  
10 obtained by the shooting are combined together to  
generate a combined image of the object. A measuring  
region of the generated combined image is designated. A  
measurement path measuring program is created by  
inputting parameters for creating a measurement path.  
15 The designated measuring region is measured along the  
measurement path according to the created measurement  
path measuring program.
